Specifications

1200 x 400 x 50mm
(400 centers Rafters) 12 pieces per pack 5.76 sq.m.

U-Values based on 350mm of Thatch with 50mm of Thatch Insulation Batts = 0.16

Benefits

• During a fire demonstration carried out on two identically constructed thatched roofs (one insulated with two layers of Thatch Insulation Batts, one without), the insulated house provided up to 1-hour fire protection to the underside of the thatch.

• The installation of 50mm of batts with a standard 300mm thatched roof significantly improves the thermal (U value) of the roof and will meet the requirements of the current Building Regulations.

• Dispensation to the 12-meter rule regarding new build thatch, and extensions to existing thatch, have been obtained using insulation batts.

Applications

Thatch Insulation Batts are fitted between the rafters. They are very light and easy to cut to any shape with a sharp knife.

Thatch Insulation Batts are compression wrapped in polythene for short term protection. For long term protection they should be stored indoors or under waterproof covering.

Thatch Insulation Batts are non-combustible high quality resin bonded lightweight rockwool slabs, designed to provide fire protection to the underside of thatched roofs on new buildings and/or extensions to existing buildings. They will also provide thermal and acoustic insulation.

1200 x 400 x 50mm in packs of 12
